

NMAT Performance Evidence for CHED Cut-Off Policy Review

This dashboard presents descriptive evidence from NMAT_Exodus.parquet (178,927 examinee records, 2006-2018) to inform the CMO amendment on NMAT cut-off scores. All analyses use validated data from the 4-pipeline processing system. PLE-linked analyses use the observable cohort (Year $\leq$ 2014) to avoid right-censoring bias.

National ProfileB4+ vs B5+ ThresholdsPLE-Passer LinkageInstitution and Foreign ContextKey Evidence for Policy Review

Key Evidence for Policy Review

The following findings synthesise the evidence presented in the preceding tabs. They are descriptive observations based on historical NMAT data (2006-2018) and do not constitute regulatory recommendations.

National Threshold Context

The historical NMAT examinee pool ranges from approximately 70% meeting a B4+ threshold to 60% meeting a B5+ threshold (best-record examinees, 2006-2018). The marginal group between the two thresholds — B4 only — accounts for roughly 10 percentage points of the examinee population.

Institutional Performance Patterns

Public institution examinees show a higher median bin rank (56) than Private institution examinees (48). This pattern is consistent across all NMAT years and may reflect differences in pre-medical preparation, admission selectivity, or other institutional factors not captured in this dataset.

NMAT-to-PLE-Passer Linkage Gradient

NMAT-to-PLE-passer linkage increases with score bin, from 8% in the lowest bin (B1) to 76% in the highest bin (B10). This historical gradient provides context for evaluating the relationship between NMAT scores and licensure outcomes, but is not a PLE pass rate.

Historical Linkage Trends

The observable NMAT-to-PLE-passer linkage rate declined from 55.6% in 2006 to 37.8% in 2014 across the observable cohort. The 5-year rolling average, which smooths annual fluctuations, was 43.5% as of 2014. This measure reflects NMAT examinees later matched to PLE passer records and is not directly comparable to official PLE passing rates.

Public School Threshold Attainment

Public school examinees already meet the B5+ threshold at a high rate: 64.9% (17,482 out of 26,937) score at Bin 5 or above. Only 8.3% fall in the B4-only band that the CMO exception addresses. This suggests the exception may not primarily benefit the intended disadvantaged groups, though GIDA/IP status is not available in this dataset for direct verification.

PLE Matching Robustness

Using the strictest defensible PLE matching criteria (single best-record, clean deterministic match, ≥ 5 year gap, Filipino nationals only), the analysis yields 23,357 B5+ matched passers representing 36.2% of the observable cohort. The distribution by university type and year in this clean subset mirrors the broader analysis, confirming the findings are robust to matching quality concerns.

Foreign Examinee Presence

Foreign nationals represent approximately 18.2% of all NMAT records (32,501 verified foreign records out of 178,927 total). India accounts for the largest share of foreign examinees. These are NMAT examinee counts, not enrolled medical students.

Note on data scope. These findings are limited to the NMAT examinee population captured in NMAT_Exodus.parquet. Key gaps in the available data include PLE failure rates (only passers are identifiable), GIDA/IP status, medical school admissions and enrollment figures, and institutional admission criteria. See the Data, Methods, and Limitations tab for full documentation.
